1 SYSTEM OVERVIEW

1.1 Problem Description

Many individuals face significant challenges when searching for reliable rental properties. One major issue is the prevalence of rental scams, where listings appear legitimate but result in financial loss after deposits are paid. In addition, the rental process is often fragmented across different platforms and handled manually, leading to problems such as lost documents, delayed application approvals, and poor tracking of rental agreements.

There is currently no single platform where landlords and tenants can effectively manage rental activities. Landlords struggle to manage property listings, screen potential tenants, and keep proper records. At the same time, tenants face difficulties in finding verified properties, submitting applications, and ensuring that the rental process is safe and trustworthy.

Smart Stay is a web-based Rental Property Management System designed to simplify and streamline the rental process by bringing all essential activities into one platform. The system aims to improve transparency, reduce fraud, and enhance efficiency by offering features such as verified property listings, digital applications, document management, and application tracking. Payments are arranged and completed directly between tenants and landlords outside the system.

1.2 Business Rules / Assumptions

1. A user may register to use the application.
2. A user is able to log in and log out of the system.
3. A user may be an admin, landlord, tenant, or anonymous user.
4. Only registered users can access full system functionality.
5. A landlord may register one or more properties.
6. A property must be associated with one landlord.
7. A property may be either available or occupied.
8. An occupied property is removed from the list of available properties.
9. A tenant may browse available properties without logging in.
10. A tenant must register and log in to apply for a property.
11. A tenant may apply for one or more properties.
12. A landlord may review applications for their properties.
13. A landlord may approve or reject tenant applications.
14. A landlord must upload required documents (Affidavit, ID, Property pictures).
15. An admin must verify landlord documents manually before property approval.
16. A tenant may upload required documents when applying.
17. A landlord may update or remove property listings.
18. A user must have valid credentials to access restricted features.
19. A tenant can only apply for a certain property once
20. A tenant may have one or more rental applications.
21. A rental application must belong to one property.
22. A property may have one or more rental applications.
23. A rental application must have one document (e.g. Payslip)
24. A document must belong to one rental applications.
25. A review must belong to a tenant
26. A tenant may have one or more reviews.
27. A review must belong to one property.
28. A property may have one or more reviews.

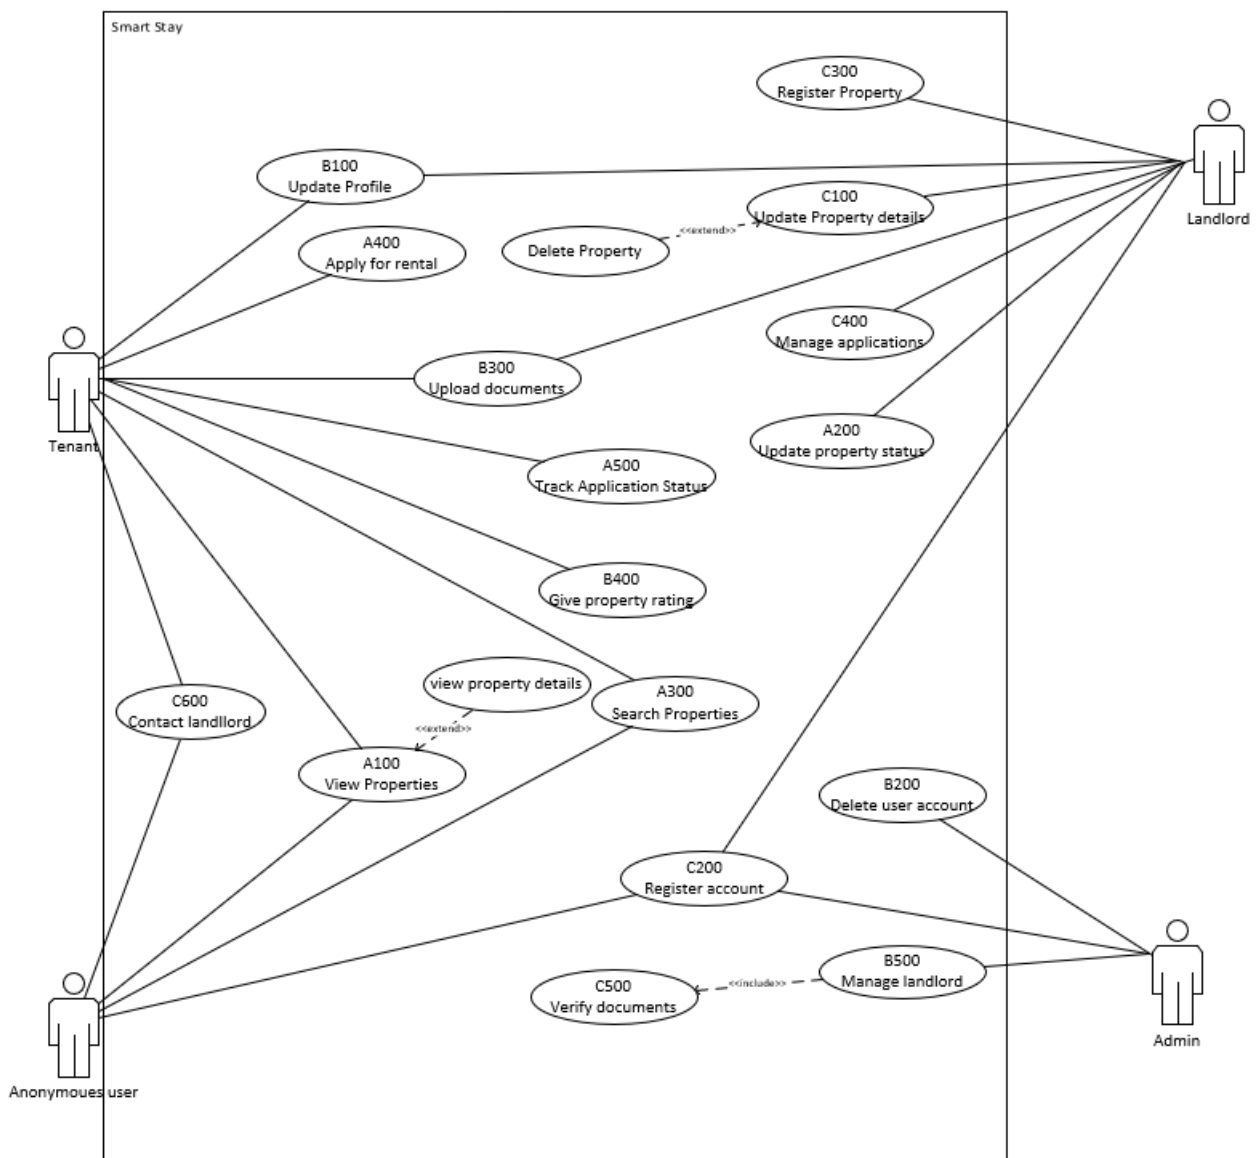

29. A listing application belongs to one property.
30. A landlord can submit multiple listing applications.
31. A property must originate from one listing application
32. Admin may manage one or more listing applications.
33. A listing application must be managed by one admin.
34. There are three admins in the system. When a user selects the Admin role, they are automatically redirected to the login page

1.3 System Constraints

1. The system is web-based only, meaning users must have internet access and a compatible browser.
2. The system depends on user-provided data accuracy (e.g., landlord documents, tenant information).
3. The system is limited to managing houses, apartments, and flats only.
4. Performance may be affected by high user traffic or large volumes of uploaded documents.
5. The landlord verification will be completed manually by the admin by viewing the affidavit submitted.
6. The system requires role-based access control, which may restrict certain functionalities for different users.

2.4.2 Individual Crew Member Use Case Narratives & UI Designs

2.4.2.1 Designed by Ratombo Rotondwa

Use Case ID	Use Case Name
A100	View properties
Actors	
Anonymous user, Tenant, Landlord and Admin	
Pre-Conditions	The system is available and running and property listing exists in the system
Triggers	The actor selects "View properties" or navigates to the property listings.
Post-Conditions	A list of available properties is displayed; the actor can view property details, and no data is changed (read-only action).
Basic Flow of Events / Main Success Scenario	
1. The actor selects the "View All" option 2. The system retrieves available property listings from the database 3. The system displays a list of properties (name, price, location, etc.) 4. The actor selects a specific property 5. The system displays detailed information about the selected property	
Initial UI Design	
	
Final Implemented UI Design	
	

Use Case ID	Use Case Name
A200	Update property status
Actors	
Landlord	
Pre-Conditions	The landlord must be registered and logged in; The landlord must own or manage the property; The property must already exist in the system
Triggers	The landlord selects the “Update Property Status” option from their dashboard
Post-Conditions	The property status is updated successfully, the new status is saved in the system (e.g., Available / Occupied / Under Maintenance) and Updated status is visible to other users
Basic Flow of Events / Main Success Scenario	
1.The landlord selects a property from their property list 2.The system displays the current property details and status 3.The actor landlord selects a new status (e.g., Available, Occupied) 4. The system validates the selection 5. The system updates and saves the new property status 6. The system confirms that the status has been updated successfully	
Initial UI Design	
	
Final Implemented UI Design	

Use Case ID	Use Case Name
A300	Search Properties
Actors	
Tenant, Anonymous user, Landlord	
Pre-Conditions	The system is operational and accessible; the actor has access to the property search interface
Triggers	The actor selects or enters the “Search Properties” function from main page.
Post-Conditions	A list of matching properties is displayed based on the user’s search criteria, if no match is found, the system displays a “No results found” message.
Basic Flow of Events / Main Success Scenario	
1. The actor enters search criteria 2. The system validates the input and processes the search request. 3. The system retrieves matching property listings from the database. 4. The system displays a list of available properties 5. The actor selects a property to view more details.	
Initial UI Design	
 The initial UI design for the 'Search Property' feature. It features a blue heading 'SEARCH PROPERTY'. Below it is a search input field with the placeholder text 'Search Property e.g. Sarah Bartman' and a magnifying glass icon. To the right of the input field is a 'Filter results' button with a dropdown arrow icon. Below these elements is a large rectangular box labeled 'Results' in the center, intended for displaying the search results.	
Final Implemented UI Design	
 This section is reserved for the final implemented UI design, which would show the actual look and feel of the search interface after development.	

Use Case ID	Use Case Name
A400	Apply for rental property
Actors	
Tenant	
Pre-Conditions	The tenant is registered and logged into the system and has selected a property to apply for.
Triggers	The tenant selects the "Apply for Rental Property" option.
Post-Conditions	The rental application is successfully submitted and stored in the system. The landlord is notified of the new application.
Basic Flow of Events / Main Success Scenario	
1.The actor tenant selects a property and clicks on the "Apply" option. 2.The system displays the rental application form. 3.The actor enters required details 4. The tenant uploads any required supporting documents. 5. The tenant submits the application. 6. The system validates the information provided. 7. The system stores the application in the database. 8. The system confirms successful submission to the tenant.	
Initial UI Design

Final Implemented UI Design	

--

Use Case ID	Use Case Name
A500	Track application status
Actors	
Tenant	
Pre-Conditions	The tenant is registered and logged into the system; tenant has previously submitted at least one rental application.
Triggers	The tenant selects the “Track Application Status” option.
Post-Conditions	The current status of the rental application is displayed to the tenant.
Basic Flow of Events / Main Success Scenario	
1. The actor tenant selects the “Track Application Status” option. 2. The system retrieves the tenant’s submitted rental applications. 3. The system displays a list of applications with their current statuses (e.g., pending, approved, rejected). 4. The actor selects a specific application to view more details. 5. The system displays detailed information about the selected application, including status updates and any feedback.

RentalApplication	-rentalApplicationID [PK] -tenantID[FK] -propertyID[FK] -landlordID[FK] -Application_date -rentalApplicationStatus -id_Number

3.2 Domain Class Diagram

3.3 Draft Implementation Ready Class Diagram

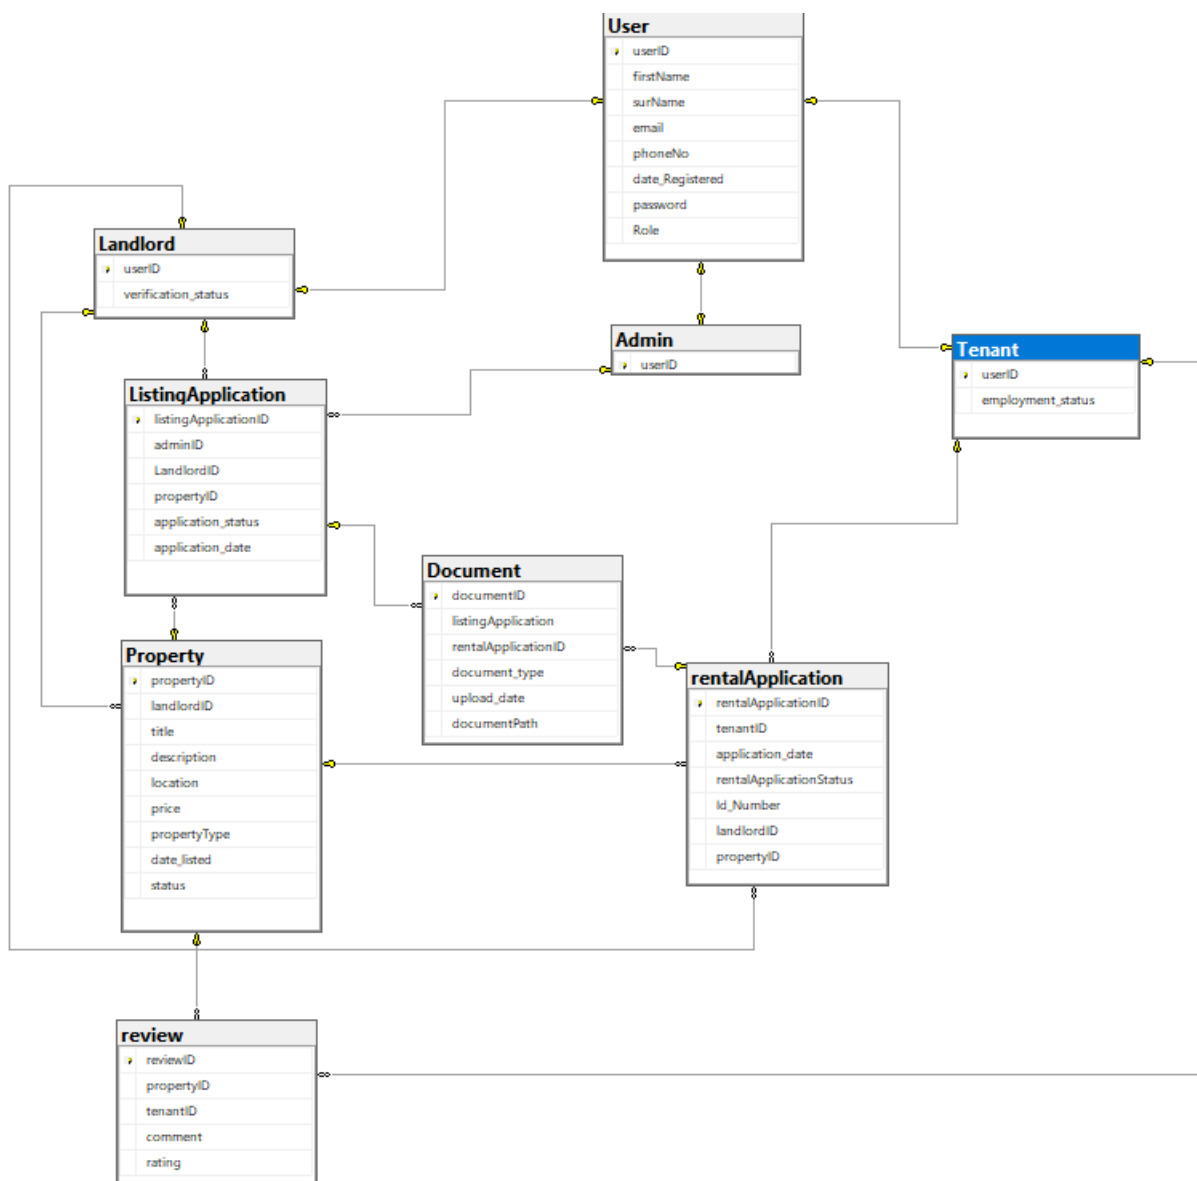

[Replace this text with the implementation ready diagram – this must be drawn in Visio.]

3.4 Implemented database structure

We have used **SSMS** to create our database in.

The name of the database for our project is **SMART_DB**

4 TECHNICAL REQUIREMENTS

4.1 System Environment

Prerequisites:

- A web browser is required (Google Chrome, Microsoft Edge)
- A stable internet connection

Operating system:

- The system can run on windows (windows 10, windows 11 and others)
- The system can also run on macOS or Linux by using browser.

Development tools:

- HTML, CSS, AND JAVASCRIPT
- ASP.NET MVC (or ASP.NET)
- Microsoft SQL Server (SQL SERVER MANAGEMENT STUDIO)

IDE:

Microsoft Visual Studio
Visual Studio Code

DLL/ EXTERNAL Libraries

SQL Server data Provider(ADO.NET)
JQUERY (front-end javascript library)

4.2 Start-up Instructions

4.2.1 Proposed System Start-up Instructions (will be updated after implementation)

The following steps describe how the system is expected to be started once implemented:

1. The user opens the system through a web browser.
2. The system initializes and establishes a connection to the database.
3. The login interface is displayed to the user.
4. The user enters valid login credentials.
5. Upon successful authentication, the user is redirected to their dashboard based on their role (Admin, Landlord, or Tenant).
6. The system loads all necessary data required for operation.

4.3 Logins & Passwords
